# Multiprocessing & Data Communication Between Process

# Multiprocessing

- Multiprocessing refers to the ability of a system to support more than one processor at the same time. Applications in a multiprocessing system are broken to smaller routines that run independently.

# CPU-Bound Process

I/O  
Waiting

CPU  
Processing

# Example

- ANN Training (Back Propagation)
- Numerical Optimization
- Matrices Multiplication

$$\begin{pmatrix} A_{1,1} & A_{1,2} \\ A_{2,1} & A_{2,2} \end{pmatrix} \cdot \begin{pmatrix} B_{1,1} & B_{1,2} \\ B_{2,1} & B_{2,2} \end{pmatrix} \rightarrow \begin{pmatrix} C_{1,1} & C_{1,2} \\ C_{2,1} & C_{2,2} \end{pmatrix}$$

$$\text{Task 1: } C_{1,1} = A_{1,1}B_{1,1} + A_{1,2}B_{2,1}$$

$$\text{Task 2: } C_{1,2} = A_{1,1}B_{1,2} + A_{1,2}B_{2,2}$$

$$\text{Task 3: } C_{2,1} = A_{2,1}B_{1,1} + A_{2,2}B_{2,1}$$

$$\text{Task 4: } C_{2,2} = A_{2,1}B_{1,2} + A_{2,2}B_{2,2}$$

# Example

Buatlah algoritma dalam bentuk pseudocode untuk chained matrices multiplication:

$Y = A \times B \times C \times D \times E \times F \times G \times H$ .  
dimana

Y, A, B, C, D, E, F, G, dan H  
adalah matriks 5 x 5

# Example

Buatlah algoritma dalam bentuk pseudocode untuk chained matrices multiplication:

$Y = A \times B \times C \times D \times E \times F \times G \times H$ .  
dimana

Y, A, B, C, D, E, F, G, dan H  
adalah matriks  $5 \times 5$

# Example

Buatlah algoritma dalam bentuk pseudocode untuk chained matrices multiplication:

$Y = A \times B \times C \times D \times E \times F \times G \times H$ .  
dimana

Y, A, B, C, D, E, F, G, dan H  
adalah matriks  $5 \times 5$

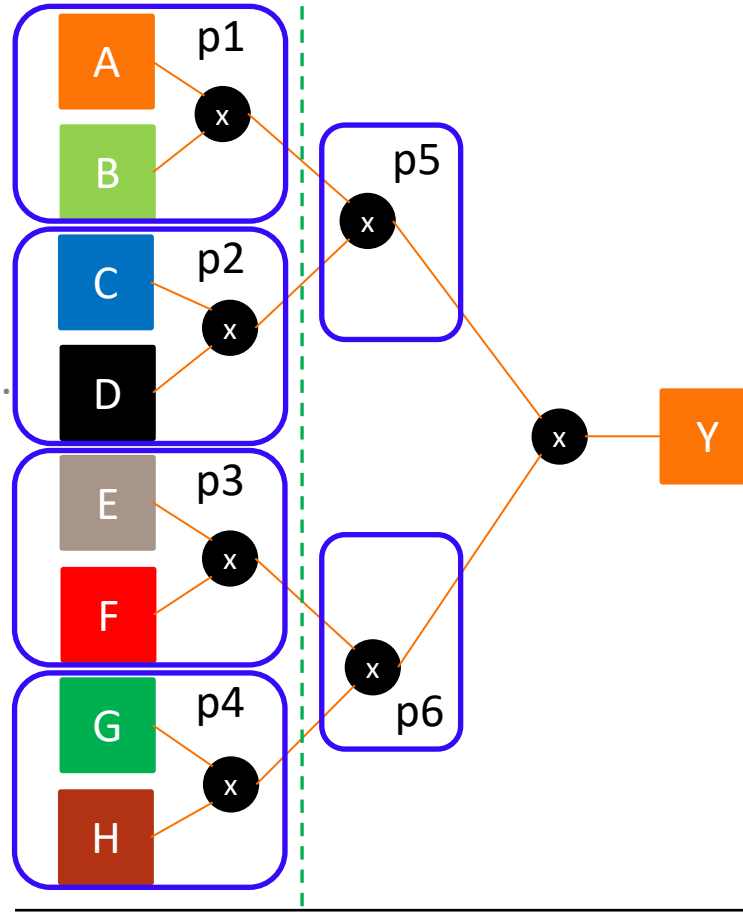

# Example

# Data Communication Between Process

**Shared Memory:** `multiprocessing` module provides **Array** and **Value** objects to share data between processes.

- **Array:** a ctypes array allocated from **shared memory**: `multiprocessing.Array('i', 4)`
- **Value:** a ctypes object allocated from **shared memory**: `multiprocessing.Value('i')`

# Data Communication Between Process

**Server process** : Whenever a python program starts, a **server process** is also started. From there on, whenever a new process is needed, the parent process connects to the server and requests it to fork a new process.

A **server process** can hold Python objects and allows other processes to manipulate them using proxies.

Terima Kasih
